Cruise Report
R/V "Oceania", AREX 2008

Ship: R/V "Oceania"

Cruise: AREX 2008

Dates: 08.06.2008 – 22.08.2008

Port Calls: Gdansk (Poland) – Longyearbyen (Spitsbergen)

Number of Scientist: 14

Chief Scientist (open sea part of cruise): Prof. Jan Piechura

Principal Project: DAMOCLES – WP3

Research Area: Greenland Sea, Barents Sea, Norwegian Sea

Open sea part of cruise – June 18 – July 23, 2008

Damocles - WP3. Oceans: Task 3.1 Input Function, Task 3.2 Shelf/Basin Exchange
Jan Piechura, Waldemar Walczowski, Ilona Gosczko, Piotr Wieczorek, Daniel Rak (IO PAS).

1. Observations in 2008

Although whole AREX 2008 cruise of the R/V Oceania was performed in the period of June 8 – August 22, 2008 main hydrological part concerning the open sea area took place between June 18 and July 23. During this time CTD (conductivity, temperature, depth) profiles along sections were done. As in previous years sections were perpendicular to the general direction of the Atlantic Water inflow according to the West Spitsbergen Current location, which is situated between the Barents Sea slope in the south-east area, the west Spitsbergen shelf-break/slope region on the north-east and system of underwater ridges: Mohns Ridge and Knipovich Ridge on the west. Because of convergence of the isobaths in the northern part, currents pattern and structure is complicated and forms wedge, wide in the southern part and narrower on the north. As before, our main effort was concentrated in the northern part of the Atlantic Domain where processes controlling the AW flow into Arctic Ocean through the Fram Strait and the westward recirculation occur.

All in all 197 CTD profiles were taken along 11 sections (Fig.1, Tab. 1). The Seabird CTD (SBE 911+) system with duplicate temperature and conductivity sensors (temperature sensors SBE3, SN 2937 and 4670, conductivity sensors SBE4, SN 2971 and 3342 and pressure sensor Digiquartz SN 100967) was used. Temperature and conductivity sensors were calibrated by the Sea-Bird Electronics service. Moreover, three high resolution CTD sections on the west Spitsbergen shelf-slope area with towed Seabird CTD (SBE49) system were obtained as well. In addition to that Water samples collected with the rosette water sampler SBE32 were analyzed as concerned nutrients contents.

Currents measurements were performed at the all CTD stations with the lowered Acoustic Doppler Current Profiler (LADCP) as well. The self-recording 300 kHz RDI device was used to profile entire water column during the standard CTD casts.

Moreover sustained currents measurements were performed during the whole cruise with the ship-mounted ADCP, RDI 150 kHz.

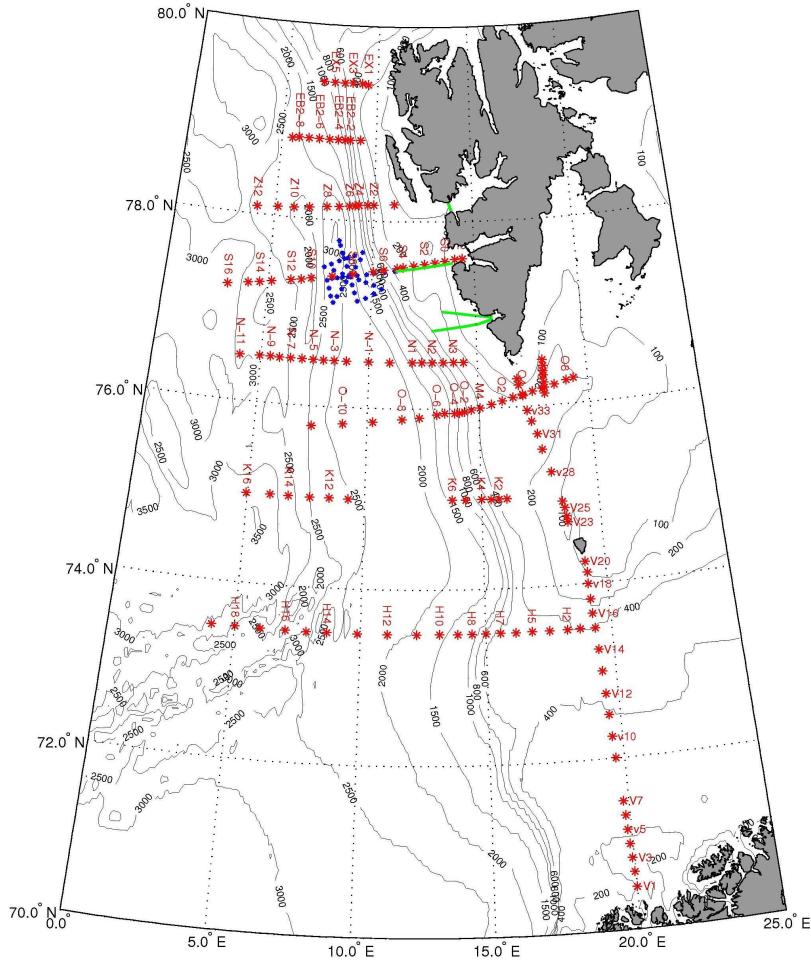

Fig. 1. CTD stations performed during Arex 2008 experiment.

2. Some preliminary results

As in previous years, 2008 cruise results show two branches of Atlantic Water in the Greenland Sea which flow northward. Main branch of the West Spitsbergen Current flows along the Barents Sea continental slope and west Spitsbergen shelf break. Colder and less saline branch continues along the Mohns and Knipovich Ridges as a jet stream of the Arctic Front. Moreover, merely a part of northward running AW moves into the Arctic Ocean, primarily along the Spitsbergen slope; western branch of AW mostly recirculates westward as Return Atlantic Current. Furthermore part of AW flowing along the Norwegian coast continues eastward into the Barents Sea.

The northern extension of the 5°C isotherm at 100 dbar (Fig.2) shows cooling of the AW layer in the Greenland Sea. After the northernmost extend in 2006, the 5°C isotherm moved back to the south close to the position from summer 2004.

After maximum in 2006, Atlantic Water salinity and temperature has decreased meaningful. At standard section ‘N’ along the 76°30’N (Fig.3a), between meridians 009-012°E, mean salinity at 200 dbar has changed from 35.112 in 2007 to 35.075 in summer 2008 (Fig.4a). Mean salinity at this standard section was still higher than 13 years mean (35.053). Changes of temperature were more

dramatic. Mean temperature at 200 dbar level has changed from 4.50°C in summer 2006, 3.84°C in summer 2007 to 3.08°C in summer 2008 and was lower than 13 years mean (3.14°C) (Fig.4b). Nevertheless the linear trends of AW temperature and salinity were still positive. Changes of temperature at standard section ‘N’ well represents temperature variability of AW layer of entire region.

Significant changes were observed in the Atlantic Water mass (AW): salinity and temperature maximum appeared in 2006. The Arctic Atlantic Water was characterized by slightly salinity increasing in 2008, which can be effect of mixing with more saline AW in previous years. Consequence of solarisation is clearly visible in the Warm Surface Water (WSW), especially in 2006. Small changes were noted in the Arctic Intermediate Water (AIW) and the Nordic Sea Deep Water (NDW) (Fig.5).

Interaction of two current systems: West Spitsbergen Current and Sørkapp Current occurs on the shelf and continental slope regions west of Spitsbergen. Both currents flow north and Arctic Costal Front forms between them. Towed CTD sections across the west Spitsbergen shelf near entrance to the Hornsund and Bellsund Fjord show interactions between the West Spitsbergen Current, Sørkapp Current and fjord outflow and intensive mixing processes (Fig.6).

In 2008 dense water plume cascading from the Storfjorden along the Storfjordrenna and shelf break was observed and, compared to the other years measurements in 2008, extreme values of main physical parameters were noted (Fig.7). In core of the plume near the bottom density reached 28.4 kg m^{-3} , salinity 35.3 and potential temperature -1.77°C . Cross-section performed on the north bank of Storfjordrenna confirms that the pathway of this rotating gravity current initially proceeds across the north bank of Storfjordrenna in accordance with the shape of isobaths and location of underwater canyons.

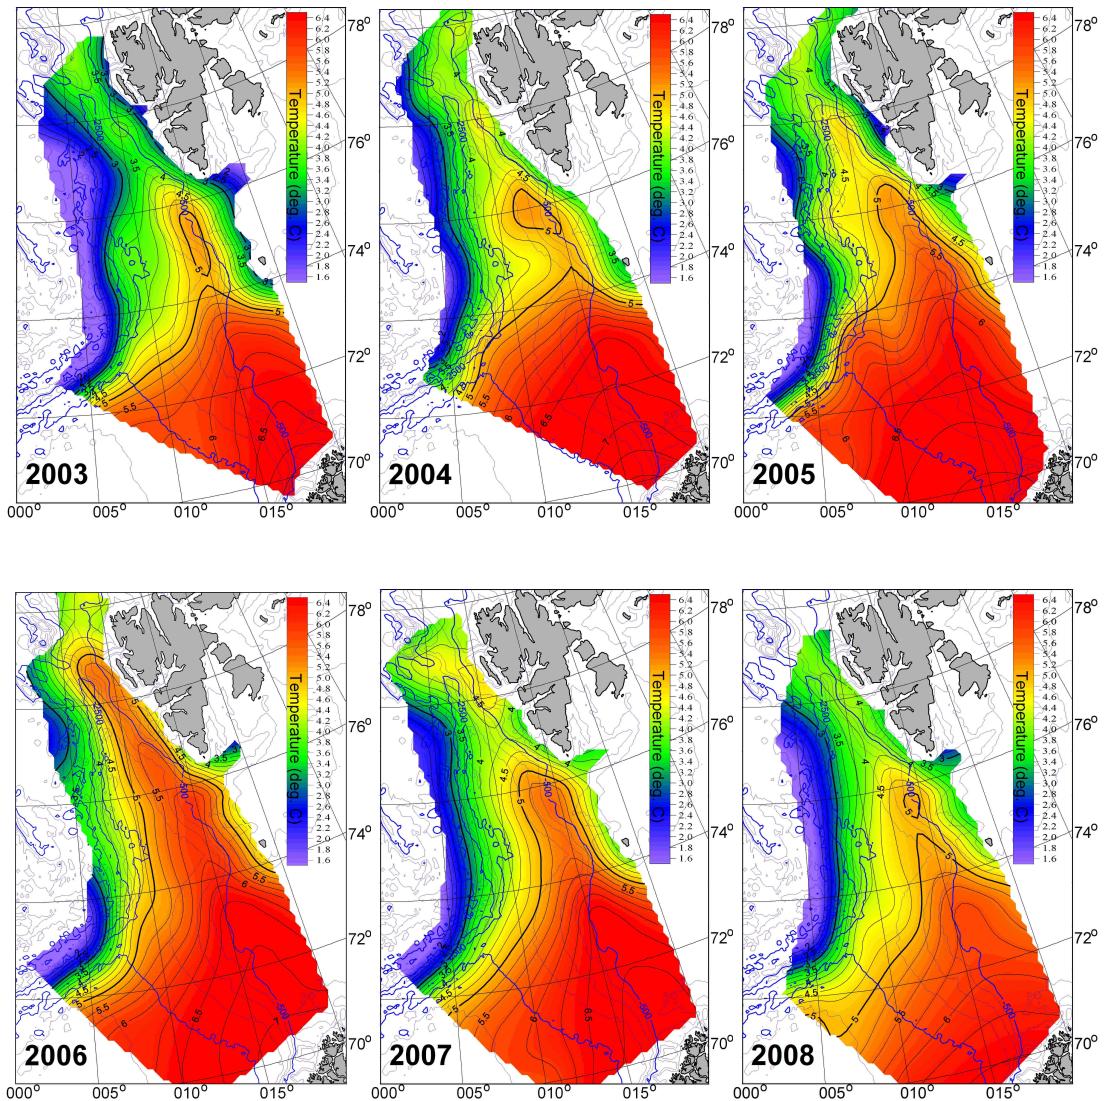

Fig. 2. Temperature (θ) and salinity distribution on the level of 100 dbar in June-July 2008. 5°C isotherm marked as a bold line.

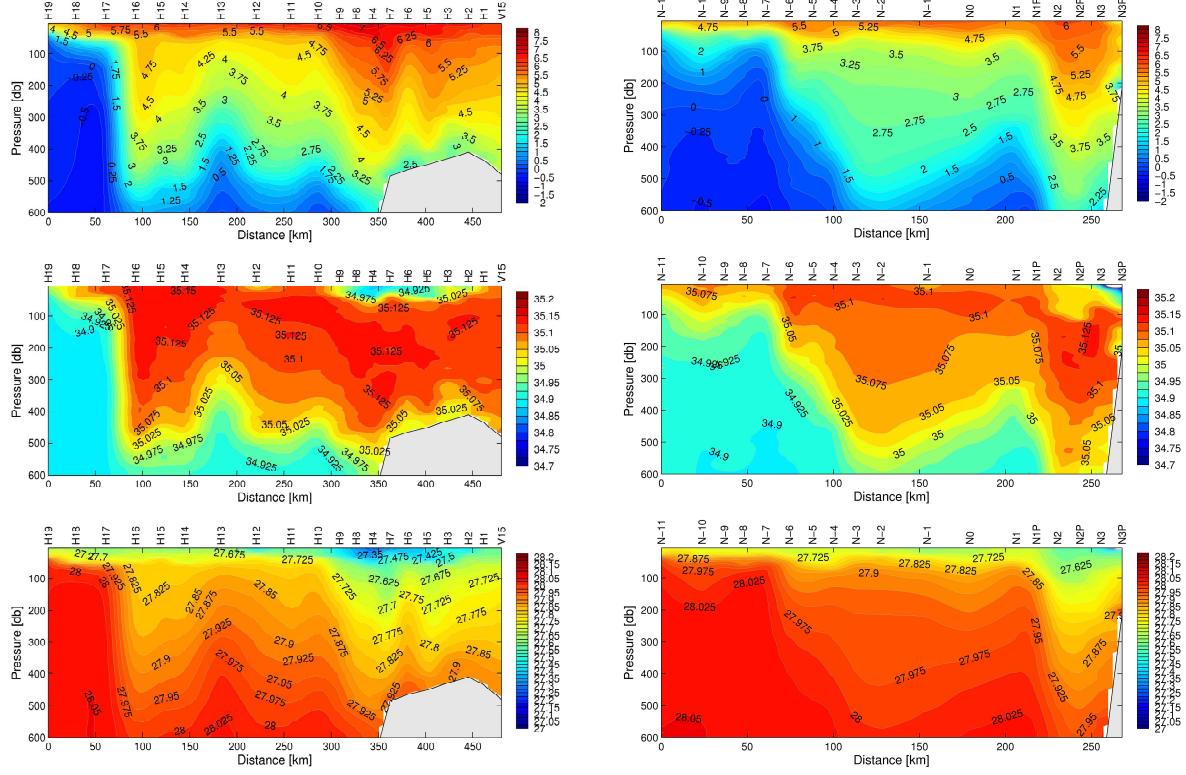

Fig. 3. Temperature (θ), salinity and density (σ_θ) distribution on the Section H ($73^{\circ}30'N$) and Section N ($76^{\circ}30'N$) in summer 2008.

Fig. 4. Mean salinity (upper panel) and mean temperature in summer (July) at section 'N' ($76^{\circ}30' N$) at 200 m, between 009° - 012° E.

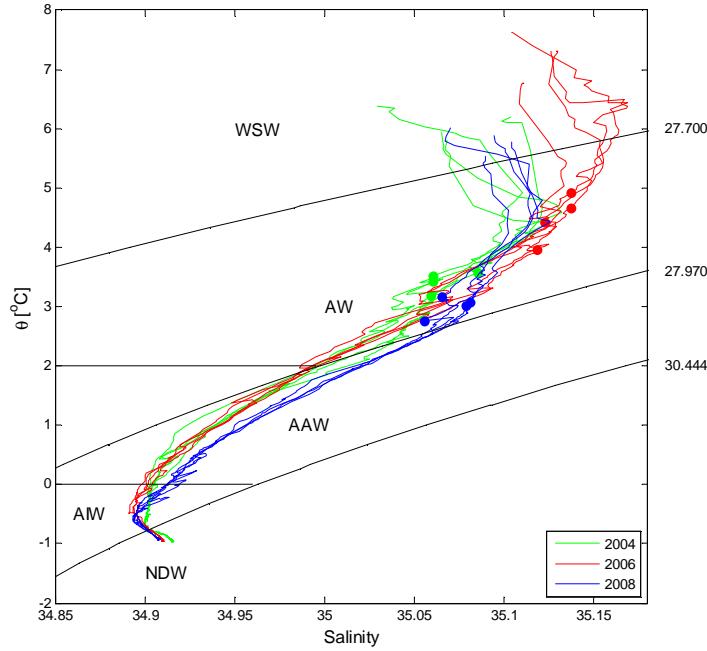

Fig. 5. TS diagram for CTD stations performed in 2004 (green lines), 2006 (red lines) and 2008 (blue lines) on the Section ‘N’ ($76^{\circ}30' N$) between 009° - 012° E. Dots (green-2004, red-2006 and blue-2008) indicate level of 200 dbar.

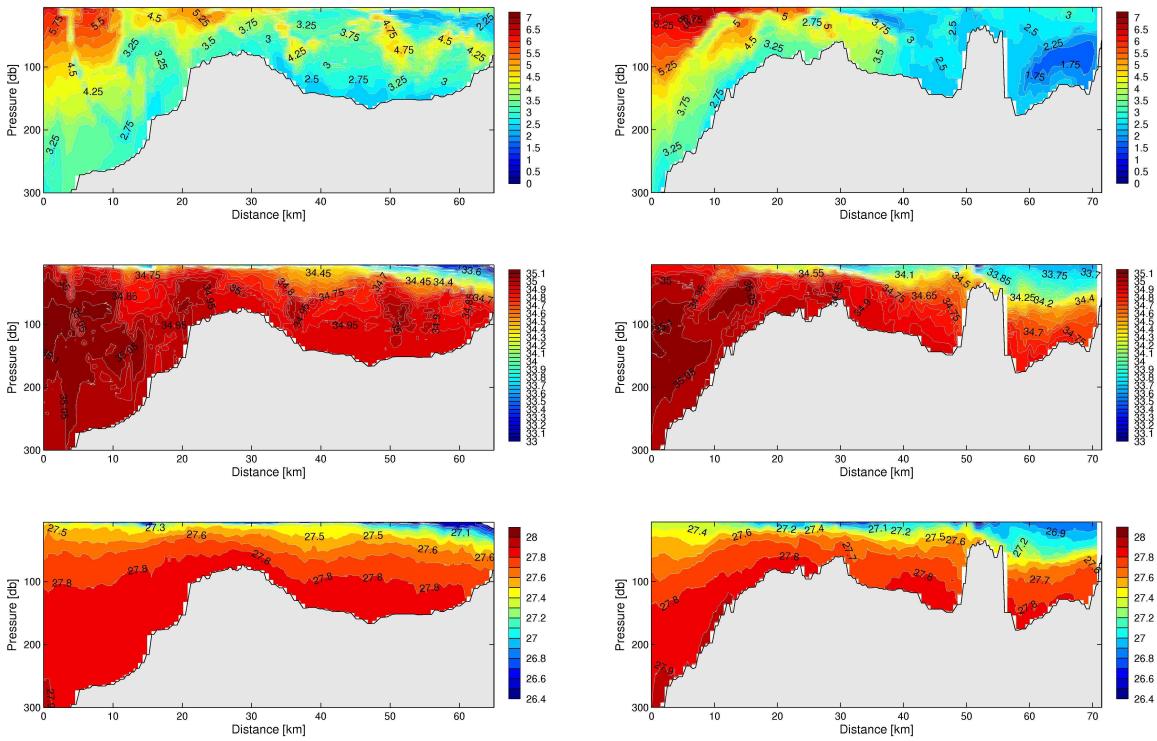

Fig. 6. Temperature (θ), salinity and density (σ_0) distribution along the high resolution sections (marked as green lines on the Fig.1) across the west Spitsbergen shelf near: a) Hornsund and b) Bellsund Fjord in summer 2008. Warm and saline Atlantic water mixes with Arctic type water, a product of ice melting and river runoff is visible as a light, fresh, surface layer.

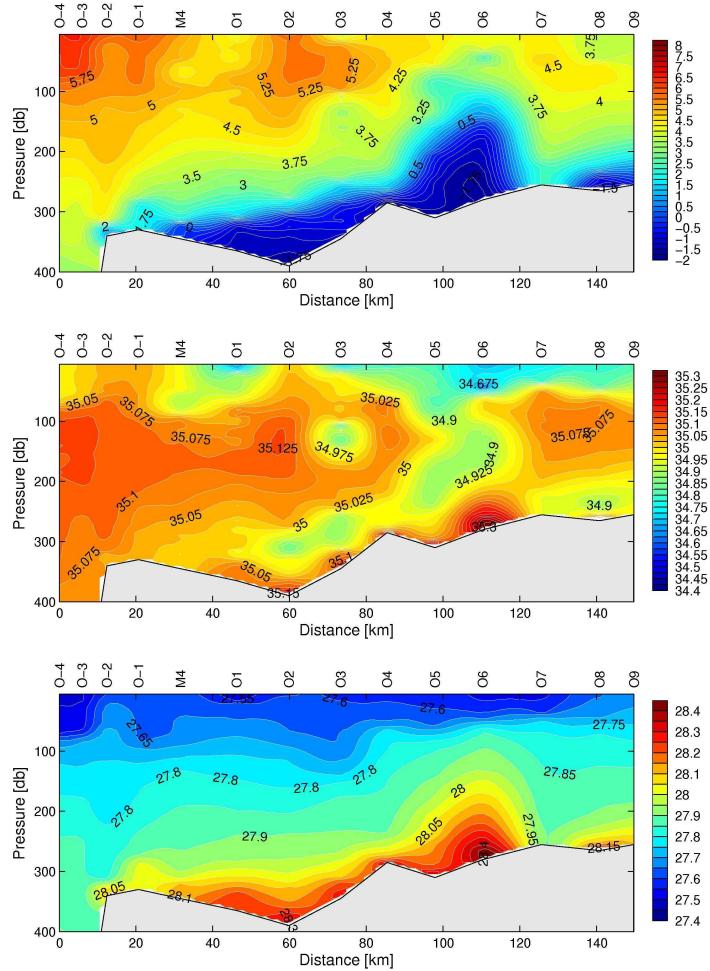

Fig. 7. Temperature (θ), salinity and density (σ_0) distribution on the Section O along the Storfjordrenna in summer 2008. Dense water plume is visible as near-bottom cascade moving down to the shelf-break. Maximal values of physical parameters are equal to: -1.77°C (θ), 35.3 (S) and 28.4kgm^{-3} (σ_0). Above the most dense layer intensive mixing and entrainment processes occur, which form plume shape.

Table 1: CTD stations and some of their main parameters. There were 11 regular sections performed in 2008.
