

**FRV Walther Herwig III
Cruise 306
30.11. – 20.12.2007**

Fish Diseases in the North Sea and Baltic Sea

Scientist in Charge: Dr. Thomas Lang

Narrative

As part of the long-term monitoring programme of the Institute for Fishery Ecology of the Federal Research Centre for Fisheries on diseases and parasites of marine fish species, studies were conducted in 8 Baltic Sea and 10 North Sea areas. In addition to the examination of dab (*Limanda limanda*), Baltic cod (*Gadus morhua*) and Baltic flounder (*Platichthys flesus*) for macroscopically visible external and internal diseases and parasites, samples were taken for studies on histopathological alterations in liver and spleen. Fish samples were frozen for the detection of contaminants in the framework of national legislation and international monitoring programmes. In addition, hydrographical measurements were carried out (water temperature, salinity, oxygen content).

There were no new trends regarding the occurrence of externally visible diseases and parasites as well as of pathological liver changes in dab from the North Sea and the prevalences recorded were in the same range as in winter 2006. The same was true for Baltic flounder. In Baltic cod, the prevalence of acute/healing skin ulcerations and skeletal deformities both in the western and the eastern stock were low and were comparable to previous years.

Participants:

Name	Function	Institution
Dr. Thomas Lang	Scientist in Charge	FOE, Cuxhaven
Thomas Tepperies	Technician	FOE, Cuxhaven
Paul Kotterba	Student	University Hamburg
Nico Geveke	Student	University Oldenburg
Melanie Erhartmaier	Biologist	Berlin
Hilke Alberts-Hubatsch	Student	University Oldenburg
Soya Kim	Biologist	Göttingen
Felix Baumgart	Biologist	University Rostock
Franziska Schade	Student	University Rostock
Petra Jantschik	Biologist	University Rostock
Andreas Brietzke	Student	University Rostock
Jasmin Ingeborg Kirchbaumer	Biologist	University Innsbruck

Objectives of the Cruise

1. Studies on the prevalence and spatial distribution of fish diseases and parasites;
2. Studies on biological effects of contaminants;
3. Sampling of fish for chemical analysis of radioactive substances, trace metals and organic contaminants (in the framework of national and OSPAR and HELCOM monitoring);
4. Hydrographic measurements (salinity, temperature, oxygen);
5. Sampling of fish organs for subsequent histological studies.

Dates of the Cruise

RV Walther Herwig III left Bremerhaven on 30.11. heading for Kiel Channel and the Baltic Sea where work started in area B12 on 01.12., followed by sampling in 7 further Baltic Sea areas. After the passage of Kiel Channel on 09.12., 10 North Sea sampling areas were visited, beginning with area N11 in the German Bight. The cruise ended according to plan on 20.12. in Bremerhaven.

The location of the sampling areas and the cruise dates are shown in Figure 1 and Tables 1a and 1b.

In 18 sampling areas (Fig. 1), a total of 75 fishing hauls was performed (towing time 1 h each) (see Table 1a). In the North Sea, the GOV was used, in the Baltic Sea a 140 ft bottom trawl with rock hoppers. Hydrographical measurements were made at 32 stations (see Table 1b).

Preliminary Results

1 Dab (*Limanda limanda*)

In total, 7,575 dab (including 1,301 in the Baltic Sea) were examined for the occurrence of externally visible diseases and parasites and 835 dab for the occurrence of liver anomalies. Results are provided in Tables 4 and 5.

The decrease in prevalence of lymphocystis recorded over the past years did not continue; the prevalence was higher in the majority of sampling areas compared to winter 2006. Maximum values of > 20 % were recorded in areas N10, N06, N05 and N04 (see Fig. 1). In the German Bight, prevalences were considerably lower with values of 7.0 % (N01) and 2.0 % (GB1), respectively. No change in prevalence was noted for epidermal hyperplasia/papilloma; values were in the range of 0.0 % to 5.6 % and were, thus, relatively low. Skin ulcers were slightly less prevalent than in winter 2006 (range: 0.0% - 3.4%). The prevalence of hyperpigmentation varied between 0.0 % and 51.5 % and was in the range of the previous years. However, compared to summer 2006, the prevalence had increased in the German Bight (N01, GB1). Hyperpigmentation was absent in the Baltic Sea. No changes occurred for the parasites *Stephanostomum baccatum*, *Acanthochondria cornuta* und *Lepeophtheirus pectoralis*.

The prevalence of liver nodules was in the same range that was observed in winter 2006; areas with elevated values still are the Dogger Bank (N04) and an area far off the Humber (N22). The prevalences of livers with green discoloration, liver nematodes or acanthocephalans did not change significantly compared to last year.

2 Cod (*Gadus morhua*)

5,229 Baltic cod were examined for the occurrence of externally visible diseases and parasites (see Table 6). Because of the small catches of cod in the North Sea (see Table 2), no investigations were carried out there. The mean prevalence of acute/healing skin ulcerations in the Baltic stock was 5.8 % and was, thus, relatively low (as in the most previous years). There was no conspicuous difference between sampling areas with a sufficient number of fish examined. Skeletal deformities were rare and the maximum prevalence recorded was 2.7 % (B03). No new trends for the parasites *Lernaeocera branchialis* and *Cryptocotyle lingua*.

3 Flounder (*Platichthys flesus*)

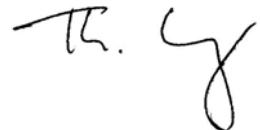

1,041 Baltic flounder were examined for externally visible diseases (Tab. 7). The prevalence of lymphocystis was slightly lower than in winter 2006 and ranged from 5.7 % (B12) to 36.1 % (B03). The prevalence of acute/healing skin ulcerations ranged from 0.0 % (B01) to 7.1 % (area B09). Only 10 (0.96 %) of all flounder examined were afflicted with liver nodules > 2 mm. This confirms earlier findings and highlights the generally low prevalence of macroscopic liver tumours in Baltic flounder.

Miscellaneous

The mean catch data of the most frequent fish species are provided in Table 2; Tables 3a and 3b give results of the hydrographical measurements.

Acknowledgements

Thanks are due to Captain Vandrei and his crew and to the scientific staff for a successful cruise, constructive and hard work and a good atmosphere on board.

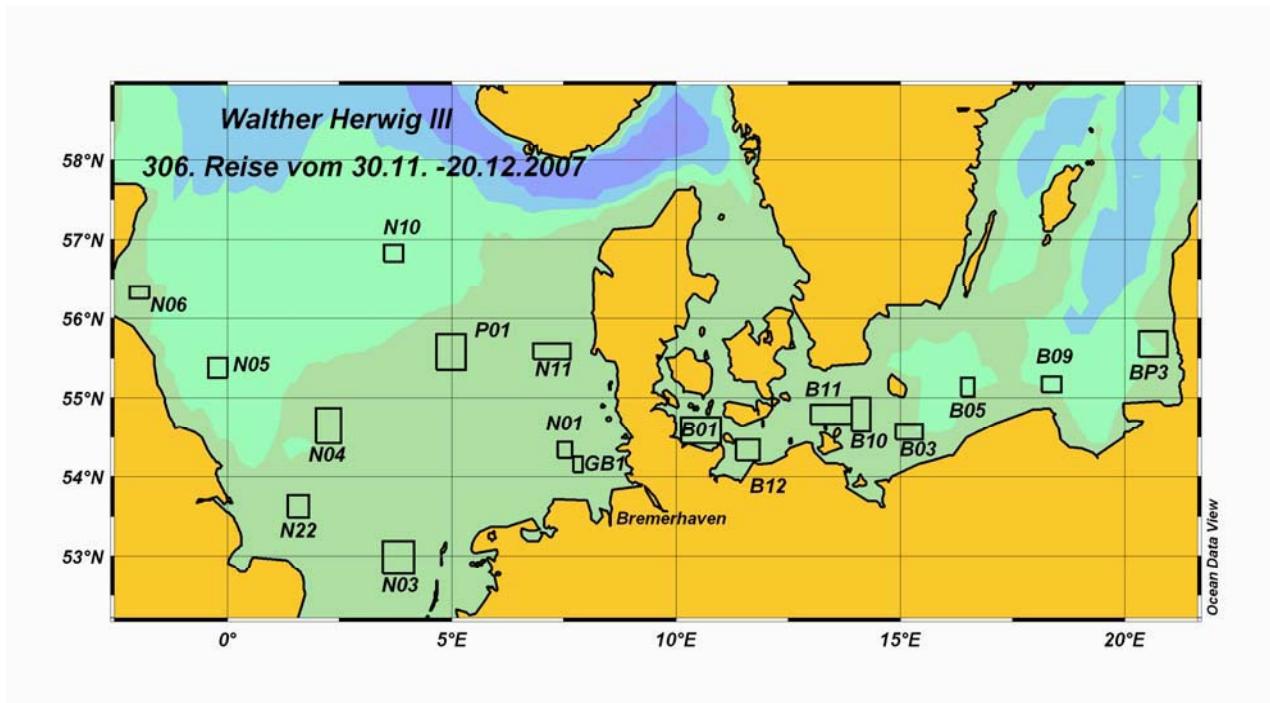

Dr. Thomas Lang

(Scientist in Charge)
