## **International Acoustic Survey for Pelagic Fish Stocks in the North Sea**

### **Cruise 559 FRV "SOLEA"**

**Date: 29.06. - 18.07.2006**

#### **Participants:**

E. Bethke	Inst. for Fishery Technology, Hamburg
M. Drenckow	Inst. for Fishery Technology, Hamburg
G. Gentschow	Inst. for Sea Fishery, Hamburg
C. Konrad	University Aberdeen
D. Risch	FTZ/University Kiel
N. Rohlf	Inst. for Sea Fishery, Hamburg
J. Ulleweit	Inst. for Sea Fishery, Hamburg

#### **Objective**

The 559th survey of the FRV "Solea" was conducted in the framework of the international hydroacoustic survey on pelagic fish in the North Sea, which is co-ordinated by the ICES Planning Group for Herring Surveys (PGHERS). The main objective was to assess clupeoid resources, mainly herring and sprat, in the North Sea.

The reported acoustic survey is conducted every year to supply to ICES the most important fishery independent data (i.e. biomass estimate) for the assessment of herring and sprat stocks in the area.

#### **Narrative**

FRV "Solea" left the port of Cuxhaven on 29th June 2006. The investigation area covered the southern part of the North Sea from 52°N to 55°30'N. The acoustic survey was performed during day time. The acoustic equipment was an echosounder EK60 working on 38 kHz and 120 kHz. The hull mounted transducer ES38B and ES120-7c were calibrated under good conditions in the open sea close to the White Bank at a distance between transducer and calibration sphere of about 14 m. The echo integration, i.e. the allocation of the area backscattering strength,  $s_A$ , to the species was done by the post-processing system EchoView 3.10. The specific settings of the hydroacoustic equipment were used as described in the 'Manual for Herring Acoustic Surveys in ICES Divisions III, IV and VI' (ver. 3.1, ICES CM 2003/G:03, Appendix 4).

Pelagic trawl hauls were carried out to identify the target species. From each haul sub-samples were taken to determine length and weight of fish. Further sub-samples of herring and sprat were examined for sex, maturity, and age. After each trawl haul or after about 30 NM sailed hydrographical conditions were investigated with a CTD probe. The survey ended on 17th July 2006 in Cuxhaven.

## Results

The cruise track (Figure 1) reached in total a length of 3064 nautical miles. 31 trawl hauls were carried out and hydrographical parameters were measured on 64 stations.

Catch compositions of the conducted hauls are presented in Table 1. Abundance estimates of the pelagic fish species will be presented after further analysis of the data in combining  $s_A$  values, and species and size distribution of the fish on ICES statistical rectangle basis.

Eckhard Bethke  
(cruise leader)
